

A. Learned graph, seed-mean
($\lambda_{\text{causal}}=0.05$, $n=10$)B. Call graph
(34 undirected edges, 68 directed entries)C. Node-level view (exploratory)
per-seed Spearman 0.45 +/- 0.11D. G is almost a per-source-node score
(exploratory)E. h_{exact} of the validation graph
(mean over seeds; never reaches 0)F. AUC vs λ_{causal}
(points: seeds; bar: mean +/- SD)

G. Density of the binarised graph

H. Binarised graph is a DAG only at large tau
